

VINYL WINDOW & DOORS STORAGE & HANDLING GUIDE

Proper storage and handling of a Vinyl Window is very important to ensure no operational issues will occur to the window in the future. If a window or door is improperly handled or stored, distortion potentially can occur and will impact the products functionality and performance. Unfortunately, windows that are mishandled and improperly stored are not honored within our warranty. The below instructions are an absolute must do to avoid any issues from arising.

1. If windows or doors are being stored upon delivery, they must properly sit upright as they would be installed. Leaning units on their sides or storing unit's upside down will lead to hardware and functionality issues.
2. Additionally, all shrink wrap should be immediately removed & opened to allow the units to breathe. Vinyl is considered a malleable product while exposed to a significant heat source. Warping of the vinyl could occur if the window is not exposed to circulated cool air.
 - a. This is to be treated as the equivalent of locking a baby in the backseat of a car with the windows up.
3. Never store product in any type of tight enclosure, as mentioned above, warping of the vinyl can occur. It is recommended to store in an air-conditioned room.
4. While transporting product, windows & doors must be strapped upright as they would be installed. While we manufacture strong quality windows, laying windows flat in a truck will lead to glass breakages. Additionally, transporting items on an angle will lead to potential operational issues.
